

OPTIGA™ Trust M

Key Features

- High-end security controller
- Common Criteria Certified EAL6+ (high) hardware
- Turnkey solution
- Up to 10kB user memory
- PG-USON-10-2,-4 package (3 x 3 mm)
- Standard & Extended temperature ranges
- I2C interface with Shielded Connection (encrypted communication)
- Cryptographic support:
 - ECC : NIST curves up to P-521, Brainpool r1 curve up to 512,
 - RSA® up to 2048,
 - AES key up to 256 , HMAC up to SHA512,
 - TLS v1.2 PRF and HKDF up to SHA512
- OPTIGA™ Trust M Software Framework on Github - <https://github.com/Infineon/optiga-trust-m>
- Crypto ToolBox commands for SHA-256, ECC and RSA® Feature, AES, HMAC and Key derivation
- Configurable device security monitor, 4 Monotonic up counters
- Protected(integrity and confidentiality) update of data, key and metadata objects
- Hibernate for zero power consumption¹
- Lifetime for Industrial Automation and Infrastructure is 20 years and 15 years for other Application Profiles

Benefits

- Protection of IP and data
- Protection of business case and corporate image
- Safeguarding of quality and safety

Applications

- Industrial control and building automation
- Consumer electronics and Smart Home
- Drones

About this document

Scope and purpose

This Datasheet provides information to enable integration of a security device, and includes package, connectivity and technical data.

Intended audience

This Datasheet is intended for device integrators and board manufacturers.

¹ Leakage current < 2.5µA only

1 Introduction

As embedded systems (e.g. IoT devices) are increasingly gaining the attention of attackers, Infineon offers the OPTIGA™ Trust M as a turnkey security solution for industrial automation systems, smart homes, consumer devices and medical devices. This high-end security controller comes with full system integration support for easy and cost-effective deployment of high-end security for your assets.

1.1 Broad range of benefits

Integrated into your device, the OPTIGA™ Trust M supports protection of your brand and business case, differentiates your product from your competitors, and adds value to your product, making it stronger against cyberattacks.

1.2 Enhanced security

The OPTIGA™ Trust M is based on an advanced security controller with built-in tamper proof NVM for secure storage and Symmetric/Asymmetric crypto engines to support ECC NIST curves up to P-521, ECC Brainpool curve up to P-512, RSA® up to 2048, AES key up to 256, HMAC up to SHA512, HKDF up to SHA512 and SHA-256. This new security technology greatly enhances your overall system security.

1.3 Fast and easy integration

The turnkey setup – with full system integration and all key/certificate material preprogrammed – reduces your efforts for design, integration and deployment to a minimum. As a turnkey solution, the OPTIGA™ Trust M comes with preprogrammed OS/Application code locked and with host-side modules to integrate with host micro controller software. The temperature range of –40°C to +105°C combined with a standardized I2C interface and the small PG-USON-10-2,-4 footprints will facilitate onboarding in your existing ecosystem. Almost 30 years in a market-leading position with nearly 20 billion security controllers shipped worldwide are the results of Infineon's strong expertise and its commitment to make security a success factor for you.

1.4 Applications

The OPTIGA™ Trust M covers a broad range of use cases necessary for many types of applications that include the following:

- a) Network node protection using Mutual Authentication such as TLS or DTLS
- b) Protect the Authenticity, Integrity and Confidentiality of your product, data and IP
- c) Secure Communication
- d) Datastore Protection
- e) Lifecycle Management
- f) Platform Integrity Protection
- g) Secure Updates

1.5 Device Features

The OPTIGA™ Trust M comes with up to 10kB of user memory that can be used to store X.509 certificates and data. OPTIGA™ Trust M is based on Common Criteria (CC) Certified EAL6+ (high) hardware enabling it to prevent physical attacks on the device itself and providing high assurance that the keys or arbitrary data stored cannot be accessed by an unauthorized entity. The CC certificate can be found at www.bsi.bund.de by searching for

OPTIGA™ Trust M

Introduction

BSI-DSZ-CC-0961 (Hardware Identifier IFX_CCI_00000Bh) and referring to the latest CC certificate. OPTIGA™ Trust M supports a highspeed I2C communication interface of up to 1MHz (FM+).

Table 1 Products for V1

| Sales Code | Temperature range | Package | Description | Evaluation Kit |
|-----------------------------------|--|---------------------|--|---|
| OPTIGA™ Trust M SLS 32AIA010MH | -40°C to +105°C Extended Temperature Range (ETR) | PG-USON- 10-2,-4 | Embedded security solution for connected devices | XMC4800 IoT Connectivity Kit connected to the OPTIGA™ Trust M to connect to the outside world |
| OPTIGA™ Trust M SLS 32AIA010MS | -25°C to +85°C Standard Temperature Range (STR) | PG-USON- 10-2,-4 | | |

Table 2 Products for V3

| Sales Code | Temperature range | Package | Description | Evaluation Kit |
|-----------------------------------|--|---------------------|--|--|
| OPTIGA™ Trust M SLS 32AIA010ML | -40°C to +105°C Extended Temperature Range (ETR) | PG-USON- 10-2,-4 | Embedded security solution for connected devices | XMC4800 IoT Connectivity Kit connected to the OPTIGA™ Trust M to connect to the outside world. |
| OPTIGA™ Trust M SLS 32AIA010MK | -25°C to +85°C Standard Temperature Range (STR) | PG-USON- 10-2,-4 | | |

Infineon and its distribution partners offer a wide range of customization options (e.g. X.509 certificate generation and key provisioning) for the security chip.

Table 3 Features

| Features | Supported Curve/Algorithm | ToolBox commands | V1 | V3 |
|---|--|---|----|----|
| ECC | ECC NIST P256/384 | Sign, Verify, Key generation, and ECDH(E) | ✓ | ✓ |
| | ECC NIST P521, ECC Brainpool P256/384/512 r1 | Sign, Verify, Key generation, and ECDH(E) | | ✓ |
| RSA® | RSA® 1024/2048 | Sign, Verify, Key generation, Encrypt and Decrypt | ✓ | ✓ |
| Key Derivation | TLS v1.2 PRF SHA 256 | TLS PRF using SHA 256 | ✓ | ✓ |
| | TLS v1.2 PRF SHA 384/512 | TLS PRF using SHA 256/384/512 | | ✓ |
| | HKDF SHA-256/384/512 | HKDF using SHA256/384/512 | | ✓ |
| AES | Key size - 128/192/256 (ECB, CBC, CBC-MAC, CMAC) | Key generation, Encrypt and Decrypt | | ✓ |
| Random generation | TRNG, DRNG, Pre-Master secret for RSA® Key exchange | Generate random | ✓ | ✓ |
| HMAC | HMAC with SHA256/384/512 | HMAC generation and Verification | | ✓ |
| Hash | SHA 256 | Hash generation | ✓ | ✓ |
| Protected data (object) update (Integrity) | ECC NIST P256/384 RSA® 1024/2048 Signature scheme as ECDSA FIPS 186-3/RSA SSA PKCS#1 v1.5 without hashing | Secure data object update | ✓ | ✓ |
| | ECC NIST P521, ECC Brainpool P256/384/512 r1 Signature scheme as ECDSA FIPS 186-3/RSA SSA PKCS#1 v1.5 without hashing | Secure data object update | | ✓ |
| Protected Data/key/metadata update (Integrity and/or confidentiality) | ECC NIST P256/384/521 ECC Brainpool P256/384/512 r1 RSA® 1024/2048 Signature scheme as ECDSA FIPS 186-3/RSA SSA PKCS#1 v1.5 without hashing | Secure data/key object update and metadata update for Data/key object | | ✓ |

OPTIGA™ Trust M

Introduction

Table 4 Abbreviations

| Abbreviation | Definition |
|---------------------|---|
| AES | Advanced Encryption Standard |
| API | Application Programming Interface |
| BP | Brainpool |
| CA | Certification Authority |
| CC | Common Criteria |
| DRNG | Deterministic Random Number Generator |
| DTLS | Datagram Transport Layer Security |
| EAL | Evaluation Assurance Level |
| ECB | Electronic Code Book |
| ECC | Elliptic Curve Cryptography |
| ECDH | Elliptic Curve Diffie Hellman |
| ECDSA | Elliptic Curve Digital Signature Algorithm |
| ETR | Extended Temperature Range |
| CBC | Cipher block chaining |
| CBC-MAC | Cipher block chaining message authentication code |
| CMAC | Cipher-based message authentication code |
| HKDF | Hash-based key derivation function |
| I2C | Inter-Integrated Circuit |
| IETF | Internet Engineering Task Force |
| IFX | Infineon |
| IOT | Internet of Things |
| IP | Intellectual Property |
| NIST | National Institute of Standards and Technology |
| OS | Operating System |
| PAL | Platform Abstraction Layer |
| PKI | Public Key Infrastructure |
| RFC | Request For Comments |
| SHA | Secure Hash Algorithm |
| SKU | Stock Keeping Unit |
| STR | Standard Temperature Range |
| TLS | Transport Layer Security |
| TRNG | True Random Number Generator |
| USB | Universal Serial Bus |
| HMAC | Hash based Message Authentication Code |

OPTIGA™ Trust M

System Block Diagram

2 System Block Diagram

The following figure depicts the system block diagram for OPTIGA™ Trust M.

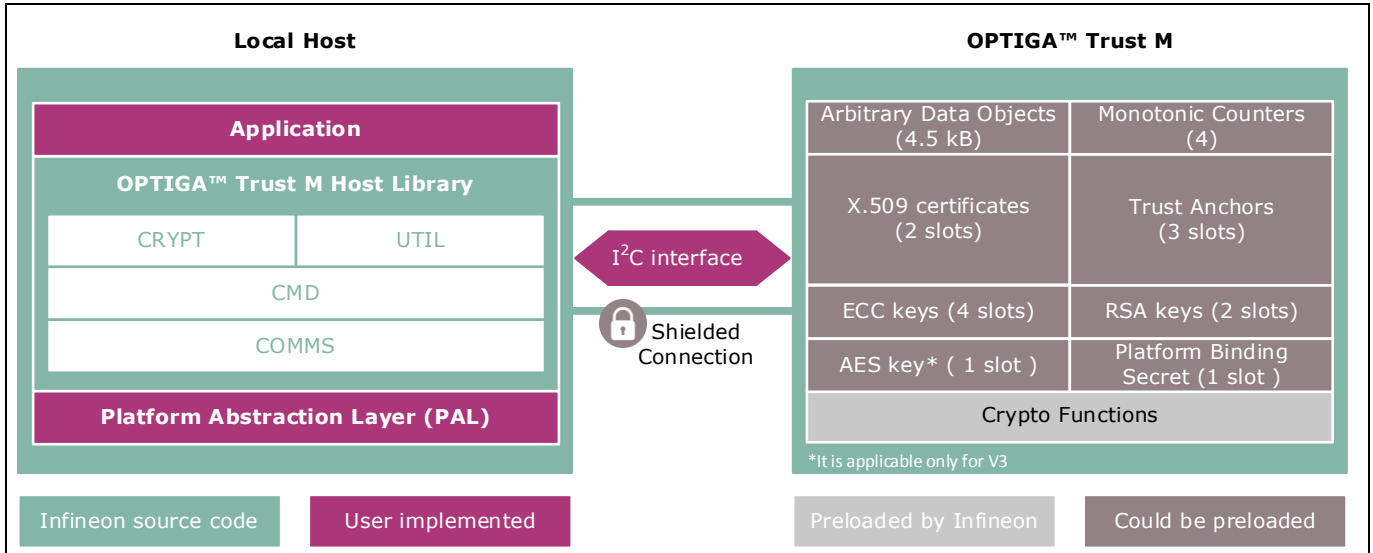

Figure 1 System Block Diagram

The System Block Diagram is explained below for each layer.

1. Local Host

- Local Host Application – This is the target application which utilizes OPTIGA™ Trust M for its security needs
- OPTIGA™ Trust M Host Library
 - CRYPT – Provides APIs to perform cryptographic functionalities. Any TLS stack can be integrated on Local Host as part of 3rd party Crypto Library to offload crypto operations to OPTIGA™ Trust M.
 - UTIL – Provides APIs such as read/write, protected update of data, metadata, key objects and open/close application (e.g. Hibernate)
 - CMD – Provides APIs to send and receive commands (Section 7) to and from OPTIGA™ Trust M
 - COMMS – Provides wrapper APIs for communication (optional encrypted communication using Shielded Connection) with OPTIGA™ Trust M which internally uses Infineon I2C Protocol (IFX I2C)
- PAL – A layer that abstracts platform specific drivers (e.g. I2C, Timer, GPIO, platform crypto library etc.)

2. OPTIGA™ Trust M

- Arbitrary Data Objects – The target application can store up to 4.5kB (~4600 bytes) of data into OPTIGA™ Trust M. The data could be additional Trust Anchors, certificates and shared secret.
- Monotonic Counters - Provides 4 monotonic counting data objects (up counters). These can be used as general purpose counter or as linked counter to other objects.
For more information, please refer to Solution Reference Manual document available as part of the package.
- X.509 – Up to 4 X.509 based Certificates can be stored

OPTIGA™ Trust M

System Block Diagram

- Keys – Up to 4 ECC , 2 RSA and 1 AES based keys can be stored
- Secret – 1 Platform binding secret can be stored
- Trust Anchors – 3 slots, for Mutual Authentication (TLS/DTLS) and Firmware Updates can be stored
- Crypto Functions - OPTIGA™ Trust M provides cryptographic functions that can be invoked via local host

Note: Unique AES key, ECC/RSA private keys and X.509 Certificates – During production at Infineon fab, unique asymmetric keys (private and public) are generated and symmetric key/shared secrets are provisioned. The public key is signed by customer specific CA and the resulting X.509 certificate issued is securely stored in the OPTIGA™ Trust M. Special measures are taken to prevent the leakage and modification of private key/shared secret material at the Common Criteria Certified production site

OPTIGA™ Trust M

Interface and Schematics

3 Interface and Schematics

This section explains the schematics of the product and gives some recommendations as to how the controller should be externally connected.

3.1 System Integration Schematics

The following figure illustrates how to integrate OPTIGA™ Trust M with your local host.

Figure 2 System Integration Schematic Diagram

Note: Value of the pullup resistors depend on the target application circuit and the target I2C frequency.

3.2 System Integration Schematics with Hibernation support

The following figure illustrates how to integrate OPTIGA™ Trust M with hibernation, with your local host.

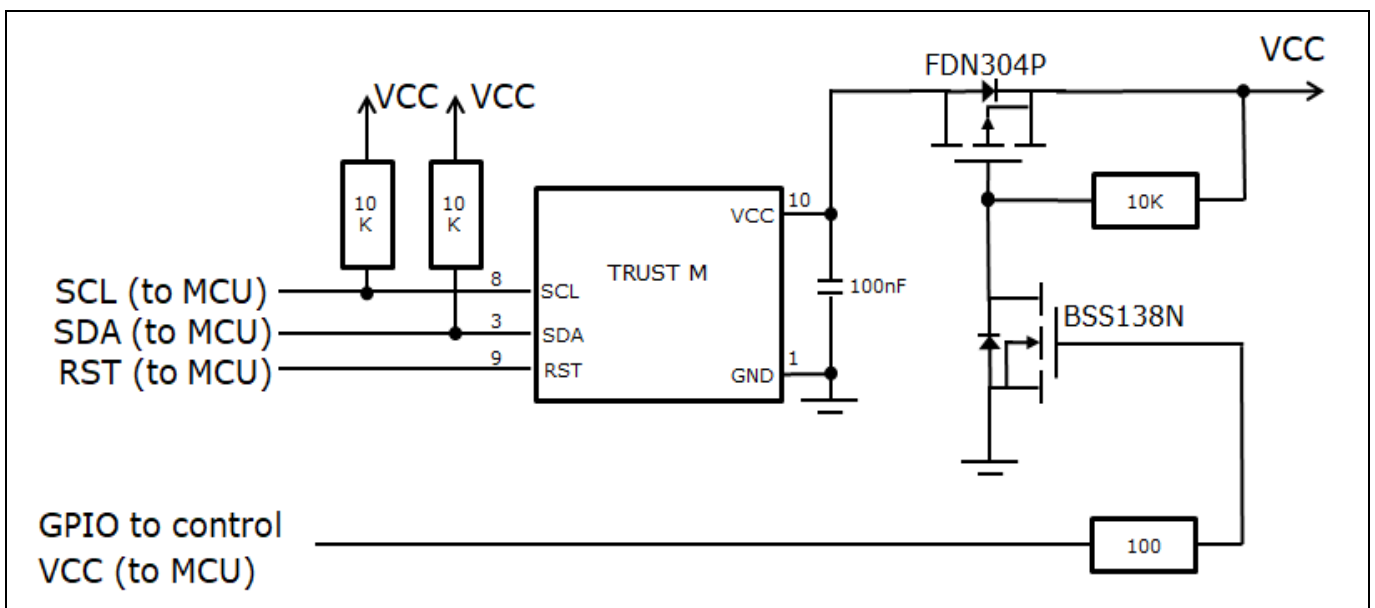

Figure 3 System Integration Schematic Diagram with Hibernation

Note: Value of the pullup resistors depend on the target application circuit and the target I2C frequency.

4 Description of packages

This chapter provides information on the package types and how the interfaces of each product are assigned to the package pins. For further information on compliance of the packages with European Parliament Directives, see “RoHS Compliance” on Page 31.

For details and recommendations regarding the assembly of packages on PCBs, please see the following: <http://www.infineon.com/cms/en/product/technology/packages/>

4.1 PG-USON-10-2,-4

The package dimensions (in mm) of the controller in PG-USON-10-2,-4 packages are given below.

Figure 4 PG-USON-10-2,-4 Package Outline

OPTIGA™ Trust M

Description of packages

The following figure shows the PG-USON-10-2,-4 in top view:

Figure 5 PG-USON-10-2,-4 top view

4.2 Production sample marking pattern

The following figure describes the productive sample marking pattern on PG-USON-10-2,-4.

Figure 6 PG-USON-10-2,-4 sample marking pattern

The black dot indicates pin 01 for the chip. The following [Table 5](#) describes the sample marking pattern:

Table 5 Marking table for PG-USON-10-2,-4 packages

| Indicator | Description |
|-----------|--|
| LOT CODE | Defined and inserted during fabrication |
| ZZ | Indicates the Certifying Authority Serial Number / SKU#, e.g. "00" would mean "SKU#00" |
| H/E | H = "Halogen-free", E = "Engineering samples" This indicator is followed by "YYWW", where YY is the "Year" and WW is the "Work Week" of the production. This is inserted during fabrication. Engineering samples have "E YYWW" and productive samples have "H YYWW" |

OPTIGA™ Trust M

Description of packages

| Indicator | Description |
|-----------|--|
| 12345 | <p>Convention: T#&\$@ where:</p> <ul style="list-style-type: none"> • The letter "T" indicates the OPTIGA Trust family • & indicates the product is a Trust M controller • # indicates the controller is a STR (S) variant • \$ specifies the OPTIGA™ Trust M release version number • @ specifies the software version <p>Example: "TMS10" means 'OPTIGA™ Trust M', 'STR variant', 'release version 1', 'software version 0'</p> |

The contacts and their functionality are given in the [Table 6](#) below.

Table 6 Contact definitions and functions of PG-USON-10-2,-4 packages

| Pin | Type | Function |
|-----|------|---|
| 01 | GND | Supply voltage (Ground) |
| 02 | NC | Not connected / Do not connect externally |
| 03 | I/O | Serial Data Line (SDA) |
| 04 | NC | Not connected / Do not connect externally |
| 05 | NC | Not connected / Do not connect externally |
| 06 | NC | Not connected / Do not connect externally |
| 07 | NC | Not connected / Do not connect externally |
| 08 | I/O | Serial Clock Line (SCL) |
| 09 | IN | Active Low Reset (RST) |
| 10 | PWR | Supply voltage (V_{CC}) |

5 Technical Data

This section summarizes the technical data of the product. It provides the operational characteristics as well as the electrical DC and AC characteristics.

5.1 I2C Interface Characteristics

Table 7 I2C Operation Supply and Input Voltages

| Parameter | Symbol | Values | | | Unit | Note or Test Condition |
|------------------------|---------------|--------|------|---|------|--|
| | | Min. | Typ. | Max. | | |
| Supply voltage | V_{CC_I2C} | 1.62 | – | 5.5 | V | |
| SDA, SCL input voltage | V_{IN_I2C} | –0.3 | – | $V_{CC_I2C} + 0.5$ or 5.5 ¹ | V | V_{CC_I2C} is in the operational supply range |
| | | –0.3 | – | 5.5 | V | V_{CC_I2C} is switched off |

1) Whichever is lower

5.1.1 I2C Standard/Fast Mode Interface Characteristics

For operation of the I2C interface, the electrical characteristics are compliant with the I²C bus specification Rev. 4 for "standard-mode" (f_{SCL} up to 100 kHz) and "fast-mode" (f_{SCL} up to 400 kHz), with certain deviations as stated in the table below.

Note: T_A as given for the operating temperature range of the controller unless otherwise stated.

Table 8 I2C Standard Mode Interface Characteristics

| Parameter | Symbol | Values | | | Unit | Note or Test Condition |
|--|-----------|--------|------|---------------------|------|---|
| | | Min. | Typ. | Max. | | |
| SCL clock frequency | f_{SCL} | 0 | – | 100 | kHz | |
| Input low-level | V_{IL} | –0.3 | – | $0.3 * V_{CC_I2C}$ | V | |
| Low-level output voltage | V_{OL1} | 0 | – | 0.4 | V | Sink current 3 mA; $V_{CC_I2C} \geq 2.7$ V Sink current 2 mA; $V_{CC_I2C} < 2.7$ V |
| Low-level output current | I_{OL} | 3 2 | – | – | mA | $V_{OL} = 0.4$ V; $V_{CC_I2C} \geq 2.7$ V $V_{OL} = 0.4$ V; $V_{CC_I2C} < 2.7$ V |
| Output fall time from V_{IHmin} to V_{ILmax} (at device pin) | t_{oF} | – | – | 250 | ns | $C_b \leq 400$ pF; $V_{CC_I2C} \geq 2.7$ V $C_b \leq 200$ pF; $V_{CC_I2C} < 2.7$ V |
| Capacitive load for each bus line | C_b | – | – | 400 200 | pF | $V_{CC_I2C} \geq 2.7$ V $V_{CC_I2C} < 2.7$ V |

OPTIGA™ Trust M

Technical Data

Table 9 I2C Fast Mode Interface Characteristics

| Parameter | Symbol | Values | | | Unit | Note or Test Condition |
|--|-----------|---------------------------------|------|---------------------|------|---|
| | | Min. | Typ. | Max. | | |
| SCL clock frequency | f_{SCL} | 0 | – | 400 | kHz | |
| Input low-level | V_{IL} | –0.3 | – | $0.3 * V_{CC_I2C}$ | V | |
| Low-level output voltage | V_{OL1} | 0 | – | 0.4 | V | Sink current 3 mA; $V_{CC_I2C} \geq 2.7 V$ Sink current 2 mA; $V_{CC_I2C} < 2.7 V$ |
| Low-level output current | I_{OL} | 3 2 | – | – | mA | $V_{OL} = 0.4 V; V_{CC_I2C} \geq 2.7 V$ $V_{OL} = 0.4 V; V_{CC_I2C} < 2.7 V$ |
| Output fall time from V_{IHmin} to V_{ILmax} (at device pin) | t_{oF} | 20 * $V_{CC_I2C} / 5.5 V^1$ | – | 250 | ns | $C_b \leq 400 pF; V_{CC_I2C} \geq 2.7 V$ $C_b \leq 200 pF; V_{CC_I2C} < 2.7 V$ |
| Capacitive load for each bus line | C_b | 15 ² | – | 400 200 | pF | $V_{CC_I2C} \geq 2.7 V$ $V_{CC_I2C} < 2.7 V$ |

1) A min. capacitive load is necessary to reach t_{oF}

2) A min. capacitive load is necessary to reach t_{rmin}

5.1.2 I2C Fast Mode Plus Interface Characteristics

For operation of the I2C interface, the electrical characteristics are compliant with the I²C bus specification Rev. 4 for "fast mode plus" (f_{SCL} up to 1 MHz), with certain deviations as stated in the table below.

Note: T_A as given for the operating temperature range of the controller unless otherwise stated.

Table 10 I2C Fast Mode Plus Interface Characteristics

| Parameter | Symbol | Values | | | Unit | Note or Test Condition |
|--|-----------|---------------------------------|------|---------------------|------|---|
| | | Min. | Typ. | Max. | | |
| SCL clock frequency | f_{SCL} | 0 | – | 1000 | kHz | |
| Input low-level | V_{IL} | –0.3 | – | $0.3 * V_{CC_I2C}$ | V | |
| Low-level output voltage | V_{OL1} | 0 | – | 0.4 | V | Sink current 3 mA; $V_{CC_I2C} \geq 2.7 V$ Sink current 2 mA; $V_{CC_I2C} < 2.7 V$ |
| Low-level output current | I_{OL} | 3 2 | – | – | mA | $V_{OL} = 0.4 V; V_{CC_I2C} \geq 2.7 V$ $V_{OL} = 0.4 V; V_{CC_I2C} < 2.7 V$ |
| Output fall time from V_{IHmin} to V_{ILmax} (at device pin) | t_{oF} | 20 * $V_{CC_I2C} / 5.5 V^1$ | – | 120 | ns | $C_b \leq 150 pF$ |
| Capacitive load for each bus line | C_b | 15 ¹ | – | 150 | pF | |

1) A min. capacitive load is necessary to reach t_{oF}

5.1.3 Electrical Characteristics

Note: T_A as given for the operating temperature range of the controller unless otherwise stated. All currents flowing into the controller are considered positive.

5.1.3.1 DC Electrical Characteristics

T_A as given for the controller's operating ambient temperature range unless otherwise stated.

All currents flowing into the controller are considered positive.

Table 11 Electrical Characteristics

| Parameter | Symbol | Values | | | Unit | Note or Test Condition |
|-------------------------------|---------------|----------------|-------|----------------|---------------|---|
| | | Min. | Typ. | Max. | | |
| Supply voltage | V_{CC} | 1.62 | – | 5.5 | V | Overall functional range |
| | V_{CC_I2C} | 1.62 | – | 5.5 | V | Supply voltage range for operation of I2C |
| Supply current ¹ | I_{CCAVG} | – | 14.0 | – | mA | While running a typical authentication profile $T_A = 25^\circ\text{C}$; $V_{CC} = 5.0\text{ V}$ |
| Supply current, in sleep mode | I_{CCS3} | – | 70 | 100 | μA | $T_A = 25^\circ\text{C}$; $V_{CC_I2C} = 3.3\text{ V}$; I2C ready for operation (no bus activity), all other inputs at V_{CC} , no other interface activity |
| RST input low voltage | V_{IL} | –0.3 | – | $0.3 * V_{CC}$ | V | $I_{IL} = -50\ \mu\text{A}$ to $+20\ \mu\text{A}$ |
| RST input high voltage | V_{IH} | $0.7 * V_{CC}$ | – | $V_{CC} + 0.3$ | V | $I_{IL} = -50\ \mu\text{A}$ to $+20\ \mu\text{A}$ |
| Hibernate current | – | – | < 2.5 | – | μA | $V_{CC} = 0\text{ V}$, $\text{GND} = 0\text{ V}$, $\text{RST} = 0\text{ V}$, $\text{SCL} = 3.3\text{ V}$ and $\text{SCL} = 3.3\text{ V}$ |

1) Supply current can be limited from 6mA to 15mA by software commands.

5.1.3.2 AC Electrical Characteristics

T_A as given for the controller's operating ambient temperature range unless otherwise stated.

All currents flowing into the controller are considered positive.

Table 12 AC Characteristics

| Parameter | Symbol | Values | | | Unit | Note or Test Condition |
|----------------------|------------|--------|------|------|---------------|---|
| | | Min. | Typ. | Max. | | |
| V_{CC} rampup time | t_{VCCR} | 1 | – | 1000 | μs | 400 mV to 90% of V_{CC} target voltage ramp |

The V_{CC} ramp is depicted in [Figure 7](#). 90% of the target supply voltage must be reached within t_{VCCR} after it has exceeded 400 mV. Moreover, its variation must be kept within a $\pm 10\%$ range.

Figure 7 **V_{CC} Rampup**

5.1.4 Start-Up of I2C Interface

There are 2 variants possible for performing the startup procedure:

- Startup after power-on
- Startup for warm resets

5.1.4.1 Startup after Power-On

The activation of the I2C interface after power-on needs the following reset procedure.

- VCC is powered up and the state of the SDA and SCL line are set to high level during power-up
- The first transmission may start at the earliest $t_{STARTUP}$ after power-up of the device

The following figure shows the startup timing of the I2C interface for this case.

Figure 8 **Startup of I2C Interface after Power-On**

Table 13 Startup of I2C Interface After Power-On

| Parameter | Symbol | Values | | | Unit | Note or Test Condition |
|--------------|---------------|--------|------|------|------|------------------------|
| | | Min. | Typ. | Max. | | |
| Startup time | $t_{STARTUP}$ | 15 | – | – | ms | |

5.1.4.2 Startup for Warm Resets

When using the reset signal for triggering a warm reset after power-on, the activation of the I2C interface needs the following reset procedure

- VCC remains powered up.
- The terminal stops I2C communication. SDA and SCL lines are set to high level before RST is set to low level.
- After its falling edge, RST has to be kept at low level for at least t_1 . At the latest t_2 after the falling edge of RST, the terminal must set RST to high level.
- The first transmission may start at the earliest $t_{STARTUP}$ after the rising edge of RST

The following figure shows the timing for this startup case.

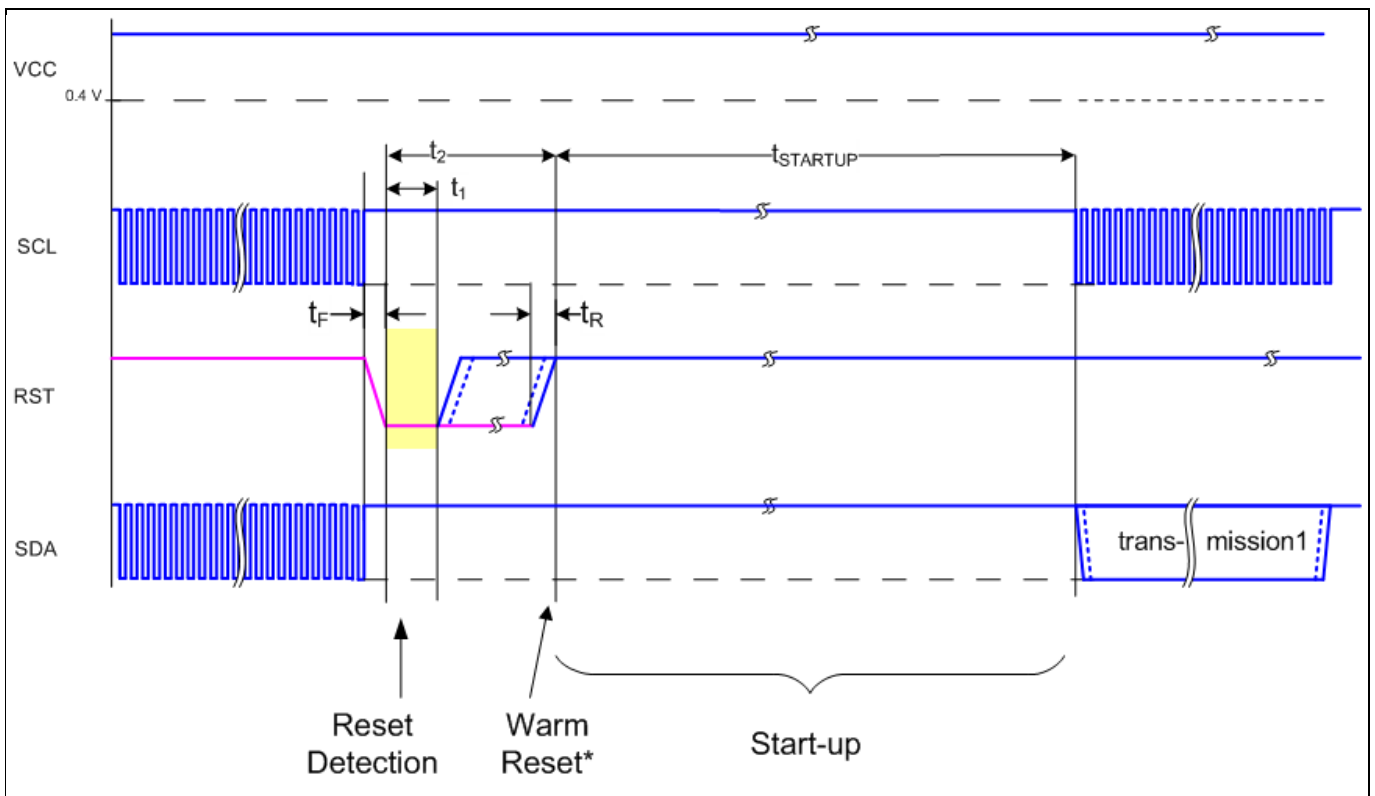

Figure 9 Startup of I2C Interface for Warm Resets

Note: If NVM programming was requested prior to the reset, $t_{STARTUP}$ will be extended from a typical value of 15 ms to a maximum of 20 ms.

OPTIGA™ Trust M

Technical Data

Table 14 Startup of I2C Interface for Warm Resets¹

| Parameter | Symbol | Values | | | Unit | Note or Test Condition |
|-----------------|----------------------|--------|------|------|---------------|-------------------------------------|
| | | Min. | Typ. | Max. | | |
| Startup time | t_{STARTUP} | 15 | – | – | ms | |
| Rise time | t_{R} | – | – | 1 | μs | From 10% to 90% of signal amplitude |
| Fall time | t_{F} | – | – | 1 | μs | From 10% to 90% of signal amplitude |
| Reset detection | t_{1} | 10 | – | – | μs | |
| Reset low | | 10 | – | 2500 | μs | |

1) Reset triggered by software (without power off/on cycle)

OPTIGA™ Trust M

Connecting to Host

6 Connecting to Host

6.1 OPTIGA™ Trust M Host Software Architecture

The OPTIGA™ Trust M Host Library layers were explained in System Block Diagram [Figure 1](#). In following sections, we will cover how to communicate with OPTIGA™ Trust M using I2C.

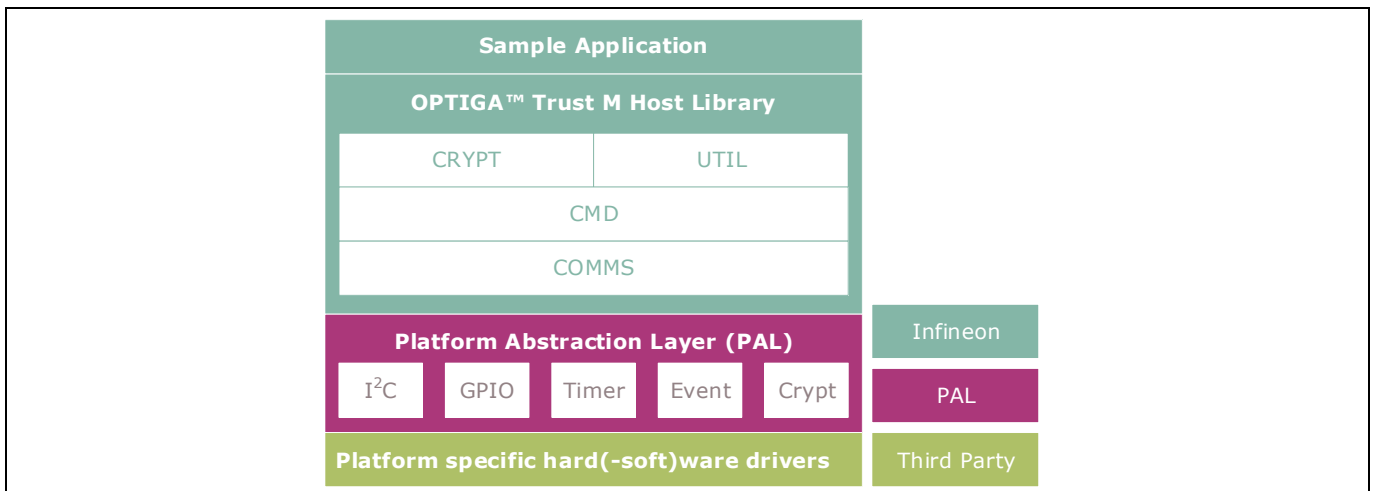

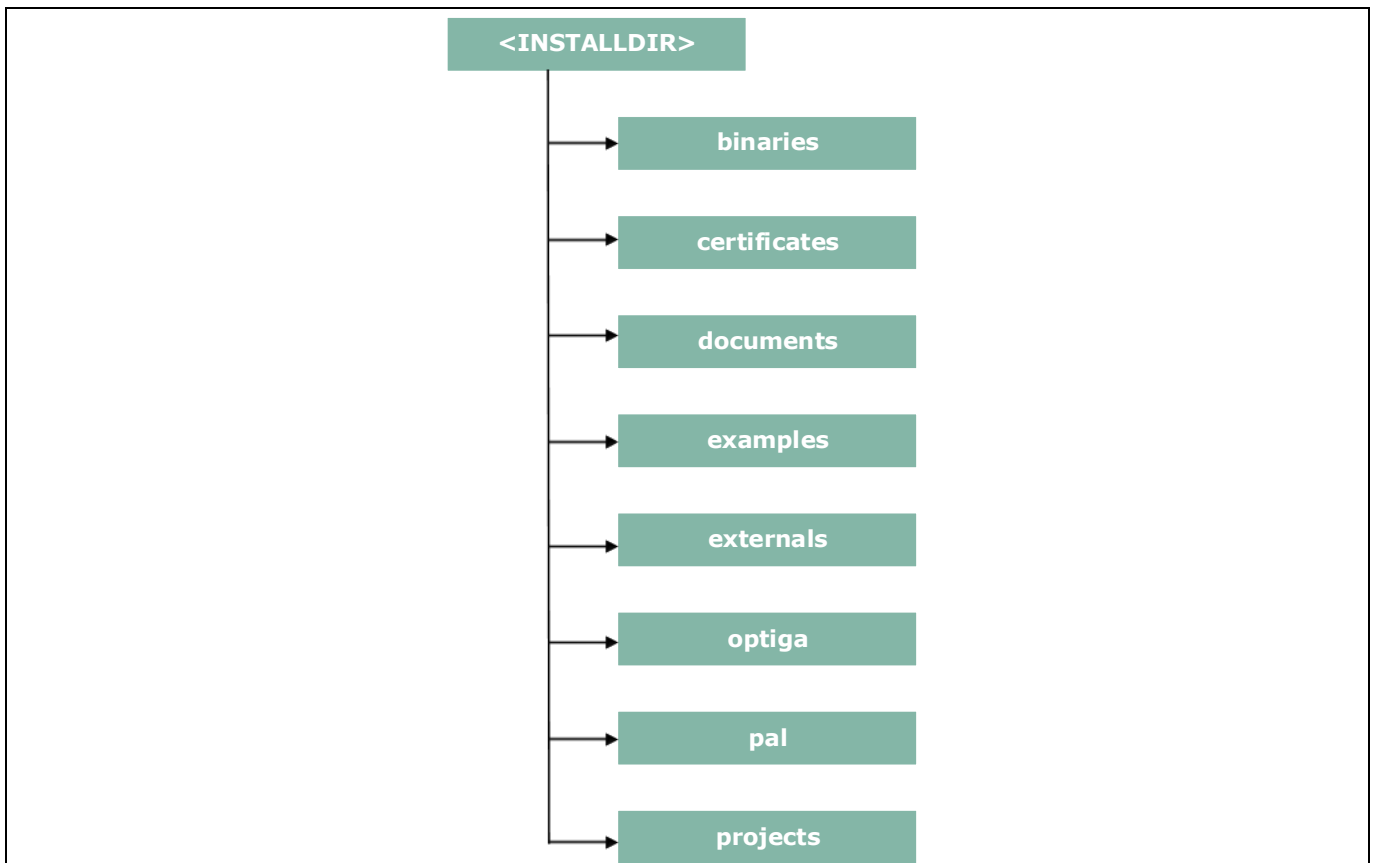

Figure 10 OPTIGA™ Trust M Host Software Architecture

6.2 Release Package Folder Structure

The following figure shows the release package structure when OPTIGA™ Trust M is installed/extracted on PC.

OPTIGA™ Trust M

Connecting to Host

Figure 11 Release Package Folder Structure

<INSTALLDIR> is the root directory to which the release package contents are extracted. The following section explains the contents of each subdirectory under installed directory:

1. binaries

This directory contains binaries for OPTIGA™ Trust M sample application.

2. certificates

This directory contains OPTIGA™ Trust M Test CA certificates.

3. documents

This directory contains all relevant OPTIGA™ Trust M documentation.

4. examples

This directory contains example usecases for Toolbox features and a tool for generation of manifest for secure update of data and key object feature.

5. externals

This directory contains mbedtls software crypto libraries.

6. optiga

This directory contains OPTIGA™ Trust M libraries.

7. pal

This directory contains PAL for XMC4800 device and for mbedtls.

8. projects

This directory contains XMC4800 device sample project in DAVE™ workspace.

Further the following figure elaborates the OPTIGA™ Trust M Host Software folder structure.

OPTIGA™ Trust M

Connecting to Host

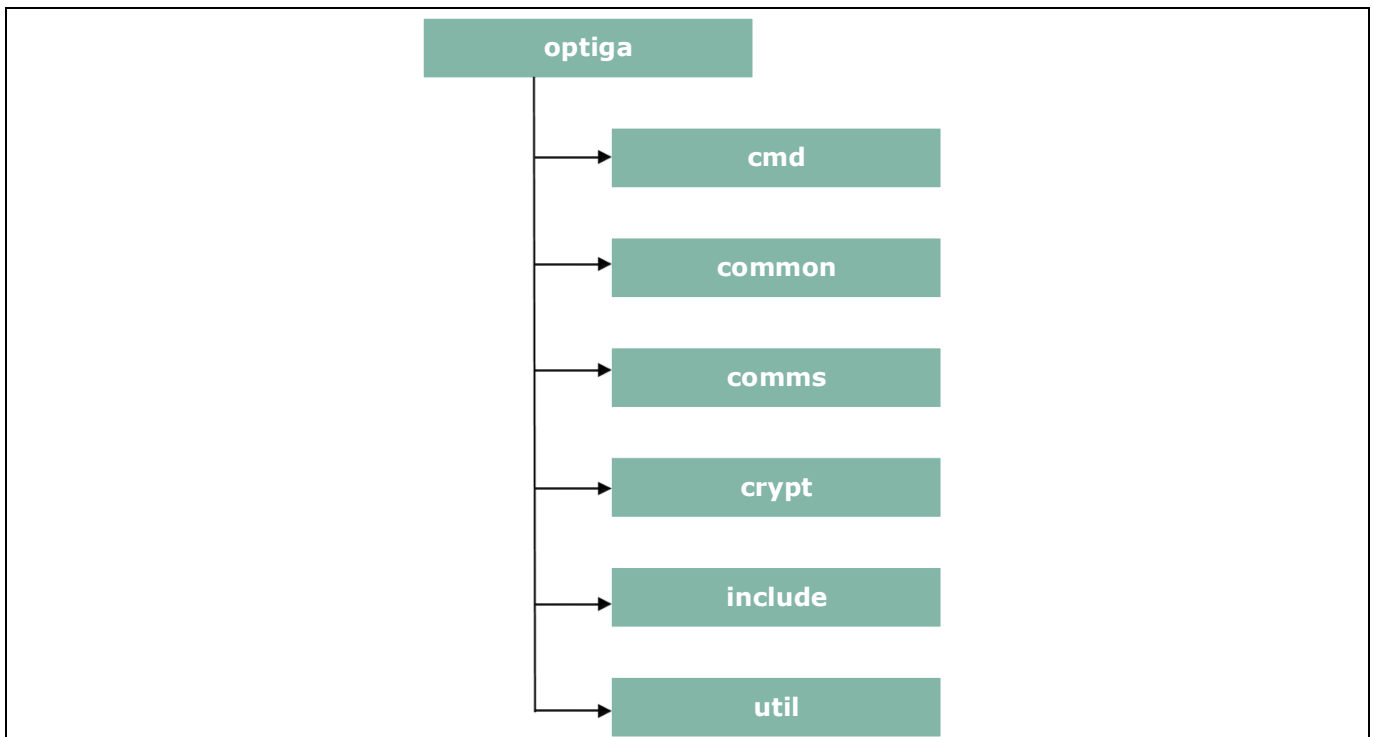

Figure 12 Host Source Folder Structure

1. cmd – This folder contains sources for all OPTIGA™ Trust M commands
2. common – This folder contains the common functions used across all the modules
3. comms – This folder contains the driver to communicate with OPTIGA™ Trust M
4. crypt – This folder contains sources for cryptographic functionalities
5. include – This folder contains header files for all OPTIGA™ Trust M Host Software
6. util – This folder contains utility functions e.g. read/write and open/close application

6.3 Porting Notes

The implementation of Platform Abstraction Layer (PAL) needs to be updated in order to migrate to a new target platform.

The PAL reference code for the XMC4800 IoT connectivity kit is provided as part of package which can be used. The implementation can be found in “<INSTALLDIR>/pal/xmc4800” and the header files are available in “<INSTALLDIR>/optiga/include” with the required APIs used by upper layers. The header files are platform agnostic and would not require any changes. The low level drivers used by PAL for XMC4800 are configured and generated using DAVE™.

6.4 Communication with OPTIGA™ Trust M

The hardware/platform resource configuration with respect to I2C master and GPIOs (Vdd and Reset) are to be updated in [pal_ifx_i2c_config.c](#). These configurations are used by the IFX I2C implementation to communicate with OPTIGA™ Trust M.

1. Update I2C master platform specific context[e.g. (void*)&i2c_master_0]

```

001      /**
001      * \brief PAL I2C configuration for OPTIGA
001      */
002      pal_i2c_t optiga_pal_i2c_context 0 =
  
```

OPTIGA™ Trust M

Connecting to Host

```

003     {
004         /// Pointer to I2C master platform specific context
005         (void*)&i2c_master_0,
006         /// Slave address
007         0x30,
008         /// Upper layer context
009         NULL,
010         /// Callback event handler
011         NULL
012     };

```

2. Update platform specific context for GPIOs (Vdd and Reset)

```

001     /**
002     * \brief Vdd pin configuration for OPTIGA
003     */
004     pal_gpio_t optiga_vdd_0 =
005     {
006         // Platform specific GPIO context for the pin used to toggle Vdd
007         (void*)&vdd_pin
008     };
009
010     /**
011     * \brief Reset pin configuration for OPTIGA
012     */
013     pal_gpio_t optiga_reset_0 =
014     {
015         // Platform specific GPIO context for the pin used to toggle Reset
016         (void*)&reset_pin
017     };

```

3. Update PAL I2C APIs [[pal_i2c.c](#)] to communicate with OPTIGA™ Trust M

The `pal_i2c` is expected to provide the APIs for I2C driver initialization, de-initialization, read, write and set bitrate kind of operations

- a) [pal_i2c_init](#)
- b) [pal_i2c_deinit](#)
- c) [pal_i2c_read](#)
- d) [pal_i2c_write](#)
- e) [pal_i2c_set_bitrate](#)

A few target platforms, the I2C master driver initialization ([pal_i2c_init](#)) is done during the platform start up. In such an environment, there is no need to implement [pal_i2c_init](#) and [pal_i2c_deinit](#) functions. Otherwise, these ([pal_i2c_init](#) & [pal_i2c_deinit](#)) functions must be implemented as per the upper layer expectations based on the need. The details of these expectations are available in the Host library API documentation (chm).

The reference implementation of PAL I2C based on XMC4800 IoT connectivity kit does not need to have the platform I2C driver initialization explicitly done as part of [pal_i2c_init](#) as it is taken care by the DAVE™ library initialization. Hence [pal_i2c_init](#) & [pal_i2c_deinit](#) are not implemented.

In addition to the above specified APIs, the PAL I2C must handle the events from the low level I2C driver and invoke the upper layer handlers registered with PAL I2C context for the respective transaction as shown in the below example.

```

001     ///I2C driver callback function when the transmit is completed successfully

```

OPTIGA™ Trust M

Connecting to Host

```

002     void i2c_master_end_of_transmit_callback(void)
003     {
004         invoke_upper_layer_callback(gp_pal_i2c_current_ctx,
005                                     (uint8_t)PAL_I2C_EVENT_TX_SUCCESS);
006     }

```

In above example the I2C driver callback, when transmission is successful invokes the handler to inform the result.

4. Update PAL GPIO [[pal_gpio.c](#)] to power on and reset the OPTIGA™ Trust M
 - a) [pal_gpio_set_high](#)
 - b) [pal_gpio_set_low](#)
5. Update PAL Timer [[pal_os_timer.c](#)] to enable timer
 - a) [pal_os_timer_get_time_in_milliseconds](#)
 - b) [pal_os_timer_delay_in_milliseconds](#)
6. Update Event management for the asynchronous interactions for I2C [[pal_os_event.c](#)]
 - a) [pal_os_event_register_callback_oneshot](#)
 - b) [pal_os_event_trigger_registered_callback](#)

The [pal_os_event_register_callback_oneshot](#) function is expected to register the handler and context provided as part of input parameters and triggers the timer for the requested time. The `p_pal_os_event` is an event instance created using [pal_os_event_create](#).

```

001     void pal_os_event_register_callback_oneshot(
002                                     pal_os_event_t * p_pal_os_event,
003                                     register_callback callback,
004                                     void* callback_args,
005                                     uint32_t time_us)
006     {
007         p_pal_os_event->callback_registered = callback;
008         p_pal_os_event->callback_ctx = callback_args;
009
010         //lint --e{534} suppress "Return value is not required to be checked"
011         TIMER_SetTimeInterval(&scheduler_timer, (time_us*100));
012         TIMER_Start(&scheduler_timer);
013     }

```

The handler registered must be invoked once the timer has elapsed as shown in [pal_os_event_trigger_registered_callback](#). The [pal_os_event_trigger_registered_callback](#) is to be registered with event timer interrupt to get triggered when the timer expires. The `pal_os_event_0` is the instance in the `pal_os_event` used store the registered callback and context.

```

001     void pal_os_event_trigger_registered_callback(void)
002     {
003         register_callback callback;
004
005         TIMER_ClearEvent(&scheduler_timer);
006         //lint --e{534} suppress "Return value is not required to be checked"
007         TIMER_Stop(&scheduler_timer);
008         TIMER_Clear(&scheduler_timer);
009
010         if (pal_os_event_0.callback_registered)

```

OPTIGA™ Trust M

Connecting to Host

```

011     {
012         callback = pal_os_event_0.callback_registered;
013         callback((void * )pal_os_event_0.callback_ctx);
014     }
015 }
```

6.5 Reference code on XMC4800 for communicating with OPTIGA™ Trust M

7 OPTIGA™ Trust M External Interface

7.1 Commands

This section provides short description of the commands exposed by the OPTIGA™ Trust M security chip and mapping of these commands w.r.t Use Cases.

Table 15 Command table

| Command Name | Description | V1 | V3 |
|--------------------|--|----|----|
| OpenApplication | Command to launch an application | ✓ | ✓ |
| CloseApplication | Command to close/hibernate an application | ✓ | ✓ |
| GetDataObject | Command to get (read) a data object | ✓ | ✓ |
| SetDataObject | Command to set (write) a data object | ✓ | ✓ |
| SetObjectProtected | Command to set (write) data protected (integrity protection) | ✓ | ✓ |
| SetObjectProtected | Command to set (write) data/key objects and its metadata protected (integrity protection, confidentiality) | | ✓ |
| GetRandom | Command to generate a random stream | ✓ | ✓ |
| CalcHash | Command to calculate a Hash | ✓ | ✓ |
| CalcSign | Command to calculate a signature | ✓ | ✓ |
| VerifySign | Command to verify a signature | ✓ | ✓ |
| CalcSSec | Command to execute a Diffie-Hellmann key agreement | ✓ | ✓ |
| DeriveKey | Command to derive keys | ✓ | ✓ |
| GenKeyPair | Command to generate public/private key pairs | ✓ | ✓ |
| EncryptAsym | Command to encrypt (Asymmetric) a message | ✓ | ✓ |
| DecryptAsym | Command to decrypt (Asymmetric) a message | ✓ | ✓ |
| EncryptSym | Command to encrypt (Symmetric) a message | | ✓ |
| DecryptSym | Command to decrypt (Symmetric) a message | | ✓ |
| GenSymKey | Command to generate a symmetric key | | ✓ |

Table 16 Mapping of commands with Use cases

| Use Case | OPTIGA™ Trust M commands used |
|---|---|
| Secure Communication with (D)TLS | GetRandom, CalcHash, CalcSign, VerifySign, CalcSSec, DeriveKey, GenKeyPair, EncryptAsym and DecryptAsym |
| Datastore (user memory ~ 4.5kB) | GetDataObject and SetDataObject |
| Symmetric key attestation, Security Tokens | EncryptSym and DecryptSym ¹ |
| Secure Firmware Update | VerifySign and DeriveKey |
| Secure update of Trust Anchors and Keys ² on Security Chip | SetObjectProtected command |

¹ EncryptSym and DecryptSym is supported only in v3

² Secure key update is supported only in v3

OPTIGA™ Trust M

OPTIGA™ Trust M External Interface

7.2 Crypto Performance

The performance metrics for various schemes are provided by the [Table 18](#) below. If not particularly mentioned, the performance is measured @ OPTIGA™ Trust M I/O interface with:

- I2C FM (400KHz)
- Without power limitation
- @ 25°C
- VCC = 3.3V
- RSA Signature scheme: RSA SSA PKCS#1 v1.5 without hashing
- ECDSA Signature scheme: ECDSA FIPS 186-3 without hashing
- Encryption/Decryption scheme: RSAES PKCS#1 v1.5
- Hash scheme: SHA256
- Key Derivation scheme: TLS v1.2 PRF SHA256, HKDF SHA256
- RSA Key size: 2048 bits
- ECC Key size: 256 bits (NIST P-256)
- AES Key size: 128 bits

Table 17 Crypto performance for V1

| Scheme | Algorithm | Performance in ms ¹ | Performance with Shielded Connection in ms ¹ | Notes |
|------------------------------|---------------------|--------------------------------|---|--|
| Calculate signature | ECDSA | ~ 60 | ~ 65 | <ul style="list-style-type: none"> • ECC NIST P 256 • No data hashing |
| | RSA | ~ 310 | ~ 315 | <ul style="list-style-type: none"> • 2048 bit exponential • No data hashing |
| Verify signature | ECDSA | ~ 85 | ~ 90 | <ul style="list-style-type: none"> • ECC NIST P 256 provided by external world • No data hashing |
| | RSA | ~ 45 | ~ 55 | <ul style="list-style-type: none"> • 2048 bit exponential provided by external world • No data hashing |
| Diffie-Hellman key agreement | ECC | ~ 60 | ~ 65 | Based on ephemeral key pair |
| Key pair generation | ECC | ~ 75 | ~ 80 | Generate 256 bit ECC key pair |
| | RSA | ~ 2900 ² | ~ 2910 | Generate 2048 bit RSA key pair |
| Encryption | RSA | ~ 30 | ~ 45 | Encrypt 127 bytes |
| Decryption | RSA | ~ 310 | ~ 320 | Decrypt 127 bytes |
| Key derivation | PRF as per TLS v1.2 | ~ 50 | ~ 55 | <ul style="list-style-type: none"> • To derive a key of 40 bytes • Shared secret (32 bytes) from session context and • The input key derivation data size is 48 bytes |
| Hash calculation | SHA256 | ~ 12 Kbyte/s | ~ 11 Kbyte/s | In blocks of 1280 bytes |

¹Minimum Execution of the entire sequence in milli seconds, except the External World timings

²RSA key pair generation performance is not predictable and typically have a variation in performance. This could be significantly higher or lower as the one specified in the table which is an average value over collected samples.

| HMAC | HMAC with SHA256 | ~ 90 | ~ 95 | Using a pre-shared secret from a data object and 128 bytes of input data |
| Hash calculation | SHA256 | ~ 15 Kbyte/s | ~ 14 Kbyte/s | In blocks of 1280 bytes |

¹Minimum Execution of the entire sequence in milli seconds, except the External World timings

²RSA key pair generation performance is not predictable and typically have a variation in performance. This could be significantly higher or lower as the one specified in the table which is an average value over collected samples.

8 Security Monitor

The Security Monitor is a central component which enforces the security policy of the OPTIGA™ Trust M. It consumes security events sent by security aware parts of the OPTIGA™ Trust M embedded SW and takes actions accordingly as specified in Security Policy below.

8.1 Security Events

The events below actively influence the security monitor.

Table 19 Security Events

| Event | Description |
|-------------------------|---|
| Decryption Failure | This event occurs in case a decryption and/or integrity check of provided data lead to a failure during protected update |
| Key Derivation | This event occurs in case the DeriveKey command gets applied on a persistent data object (not volatile data object as session context). In that case the persistent data object gets used as pre-shared secret. |
| Private Key Use | This event occurs in case the internal services are going to use an OPTIGA™ Trust M hosted private key. |
| Secret Key Use | This event occurs in case the internal services are going to use a OPTIGA™ hosted secret (symmetric) key (once per respective command), except temporary keys from session context are used. |
| Suspect System Behavior | This event occurs in case the embedded software detects inconsistencies with the expected behavior of the system. Those inconsistencies might be redundant information which doesn't fit to their counterpart. |

8.2 Security Policy

Security Monitor judges the notified security events regarding the number of occurrence over time and in case those violate the permitted usage profile of the system takes actions to throttle down the performance and thus the possible frequency of attacks.

The permitted usage profile is defined as:

1. t_{max} is set to 5 seconds ($\pm 5\%$)
2. A Suspect System Behavior event is never permitted and will cause setting the Security Event Counter (SEC) to its maximum (= 255).
3. One protected operation (refer to [Table 19](#)) events per t_{max} period.

In other words it must not allow more than one out of the protected operations per t_{max} period (worst case, ref to bullet 3. above). This condition must be stable, at least after 500 uninterrupted executions of protected operations.

For more information, please refer to Solution Reference Manual document available as part of the package.

9 RoHS Compliance

On January 27, 2003 the European Parliament and the council adopted the directives:

- 2002/95/EC on the Restriction of the use of certain Hazardous Substances in electrical and electronic equipment ("RoHS")
- 2002/96/EC on Waste Electrical and Electrical and Electronic Equipment ("WEEE")

Some of these restricted (lead) or recycling-relevant (brominated flame retardants) substances are currently found in the terminations (e.g. lead finish, bumps, balls) and substrate materials or mold compounds.

The European Union has finalized the Directives. It is the member states' task to convert these Directives into national laws. Most national laws are available, some member states have extended timelines for implementation. The laws arising from these Directives have come into force in 2006 or 2007.

The electro and electronic industry has to eliminate lead and other hazardous materials from their products. In addition, discussions are on-going with regard to the separate recycling of certain materials, e.g. plastic containing brominated flame retardants.

Infineon Technologies is fully committed to giving its customers maximum support in their efforts to convert to lead-free and halogen-free¹ products. For this reason, Infineon Technologies' "Green Products" are ROHS-compliant.

Since all hazardous substances have been removed, Infineon Technologies calls its lead-free and halogen-free semiconductor packages "green." Details on Infineon Technologies' definition and upper limits for the restricted materials can be found here.

The assembly process of our high-technology semiconductor chips is an integral part of our quality strategy. Accordingly, we will accurately evaluate and test alternative materials in order to replace lead and halogen so that we end up with the same or higher quality standards for our products.

The use of lead-free solders for board assembly results in higher process temperatures and increased requirements for the heat resistivity of semiconductor packages. This issue is addressed by Infineon Technologies by a new classification of the Moisture Sensitivity Level (MSL). In a first step the existing products have been classified according to the new requirements.

¹Any material used by Infineon Technologies is PBB and PBDE-free. Plastic containing brominated flame retardants, as mentioned in the WEEE directive, will be replaced if technically/economically beneficial.

10 Appendix A – Infineon I2C Protocol Registry Map

OPTIGA™ Trust M supports IFX I2C v2.01 and is implemented as I2C slave, which uses different address locations for status, control and data communication registers. These registers with description are outlined below in the following table.

Table 20 IFX I2C Registry Map Table

| Register Address | Name | Size in Bytes | Description | Master Access |
|------------------|----------------------------|---------------|--|---------------|
| 0x80 | DATA | DATA_REG_LEN | This is the location where data shall be read from or written to the I2C slave | Read / Write |
| 0x81 | DATA_REG_LEN | 2 | This register holds the maximum data register (Addr 0x80) length. The allowed values are 0x0010 up to 0xFFFF. After writing the new data register length it becomes effective with the next I2C master access. However, in case the slave could not accept the new length it indicates its maximum possible length within this register. Therefore it is recommended to read the value back after writing it to be sure the I2C slave did accept the new value. Note: the value of MAX_PACKET_SIZE is derived from this value or vice versa (MAX_PACKET_SIZE= DATA_REG_LEN-5) | Read / Write |
| 0x82 | I2C_STATE | 4 | Bits 31:24 of this register provides the I2C state in regards to the supported features (e.g. clock stretching ...) and whether the device is busy executing a command and/or ready to return a response etc. Bits 15:0 defining the length of the response data block at the physical layer. | Read only |
| 0x83 | BASE_ADDR | 2 | This register holds the I2C base address as specified by Table 21 . Default value is 0x30. After writing a different address the new address become effective with the next I2C master access. In case the bit 15 is set in addition to the new address (bit 6:0) it becomes the new default address at reset (persistent storage). | Write only |
| 0x84 | MAX_SCL_FREQU | 4 | This register holds the maximum clock frequency in KHz supported by the I2C slave. The value gets adjusted to the register I2C_Mode setting. Fast Mode (Fm): The allowed values are 50 up to 400. Fast Mode (Fm+): The allowed values are 50 up to 1000. | Read |
| 0x85 | GUARD_TIME ¹ | 4 | For details refer to Table 24 | Read only |
| 0x86 | TRANS_TIMEOUT ¹ | 4 | For details refer to Table 24 | Read only |

¹ In case the register returns 0xFFFFFFFF the register is not supported and the default values specified in Table 'List of protocol variations' shall be applied.

OPTIGA™ Trust M

Appendix A – Infineon I2C Protocol Registry Map

| Register Address | Name | Size in Bytes | Description | Master Access |
|------------------|------------|---------------|---|---------------|
| 0x88 | SOFT_RESET | 2 | Writing to this register will cause a device reset. This feature is optional | Write only |
| 0x89 | I2C_MODE | 2 | This register holds the current I2C Mode as defined by Table 22 . The default mode is SM & FM (011B). | Read / Write |

Table 21 Definition of BASE_ADDR

| Fields | Bits | Value | Description |
|-----------|------|-----------|--|
| DEF_ADDR | 15 | 0 1 | Volatile address setting by bit 6:0, lost after reset. Persistent address setting by bit 6:0, becoming default after reset. |
| BASE_ADDR | 6:0 | 0x00-0x7F | I2C base address specified by Table 20 |

| | | | | | | | |
|----------|-----------|----|----|----|----|---|---|
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
| DEF_ADDR | RFU | | | | | | |
| 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RFU | BASE_ADDR | | | | | | |

| | | | | | | | |
|----------|-----|----|----|----|------|---|---|
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
| DEF_MODE | RFU | | | | | | |
| 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RFU | | | | | Mode | | |
| | | | | | | | |

Table 22 Definition of I2C_MODE

| Fields | Bits | Value | Description |
|-------------------|------|--|--|
| DEF_MODE | 15 | 0 1 | Volatile mode setting by bit 2:0, lost after reset. Persistent mode setting by bit 2:0, becoming default after reset. This bit is always read as 0. |
| MODE ² | 2:0 | 001 010 011 100 other values | Sm Fm SM & Fm (fab out default) Fm+ not valid; writing will be ignored |

¹ In case the register returns 0xFFFFFFFF the register and its functionality is not supported

² This mode defines the adherence of the bus signals to the electrical characteristics according standard I2C bus specification

OPTIGA™ Trust M

Appendix A – Infineon I2C Protocol Registry Map

| | | | | | | | |
|---------------------------------|----------|-----|----|------------|-----------|-----------|----------------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
| BUSY | RESP_RDY | RFU | | SOFT_RESET | CONT_READ | REP_START | CLK_STRETCHING |
| 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| PRESENT_LAYER | RFU | | | | | | |
| 15-0 | | | | | | | |
| Length of data block to be read | | | | | | | |

Table 23 Definition of I2C_STATE

| Field | Bit(s) | Value | Description |
|----------------|--------|--------|--|
| BUSY | 31 | 0 1 | Device is not busy Device is busy executing a command |
| RESP_RDY | 30 | 0 1 | Device is not ready to return a response Device is ready to return a response |
| SOFT_RESET | 27 | 0 1 | SOFT_RESET not supported SOFT_RESET supported |
| CONT_READ | 26 | 0 1 | Continue Read not supported Continue Read supported |
| REP_START | 25 | 0 1 | Repeated start not supported Repeated start supported |
| CLK_STRETCHING | 24 | 0 1 | Clock stretching not supported Clock stretching supported |
| PRESENT_LAYER | 23 | 0 1 | Presentation Layer not supported Presentation Layer supported |

10.1 Infineon I2C Protocol Variations

To fit best to application specific requirements the protocol might be tailored by specifying a couple of parameters which is described in the following table.

Table 24 List of Protocol Variations

| Parameter | Default Value | Description |
|-----------------|---------------|--|
| MAX_PACKET_SIZE | 0x110 | Maximum packet size accepted by the receiver. The protocol limits this value to 0xFFFF, but there might be project specific requirements to reduce the transport buffers size for the sake of less RAM footprint in the communication stack. If shortened, it could be statically defined or negotiated at the physical layer. |
| WIN_SIZE | 1 | Window size of the sliding windows algorithm. The value could be 1 up to 2. |
| MAX_NET_CHAN | 1 | Maximum number of network channels. The value could be 1 up to 16. One indicates the OSI Layer 3 is not used and the CHAN field of the PCTR must be set to 0000. |
| CHAINING | TRUE | Chaining on the transport layer is supported (TRUE) or not (FALSE) |
| TRANS_TIMEOUT | 10 ms | (Re) transmission timeout specifies the number of milliseconds to be elapsed until the transmitter considers a frame |

| Parameter | Default Value | Description |
|---------------|---------------|---|
| | | <p>transmission is lost and retransmits the non-acknowledged frame. The Timer gets started as soon as the complete frame is transmitted. The value could be 1 up to 1000. However, the higher the number, the longer it takes to recover from a frame transmission error.</p> <p><i>Note: The acknowledge timeout on the receiver side must be shorter than the retransmission timeout to avoid unnecessary frame repetitions.</i></p> |
| TRANS_REPEAT | 3 | Number of transmissions to be repeated until the transmitter considers the connection is lost and starts a re-synchronization with the receiver. The value could be 1 up to 4. |
| BASE_ADDR | 0x30 | I2C (base) address. This address could be statically defined or dynamically negotiated by the physical layer. |
| MAX_SCL_FREQ | 1000 kHz | Maximum SCL clock frequency in kHz. |
| GUARD_TIME | 50 μs | <p>Minimum time to be elapsed at the I2C master measured from read data (STOP condition) until the next write data (Start condition) is allowed to happen.</p> <p><i>Note 1: For two consecutive accesses on the same device GUARD_TIME re-specifies the value of t_{BUF} as specified by [I2Cbus].</i></p> <p><i>Note 2: Even if another I2C address is accessed in between GUARD_TIME has to be respected for two consecutive accesses on the same device.</i></p> |
| SOFT_RESET | 1 | Any write attempt to the SOFT_RESET register will trigger a warm reset (reset w/o power cycle). This register is optional and its presence is indicated by the I2C_STATE register's "SOFT_RESET" flag. |
| PRESENT_LAYER | 1 | This flag at the I2C_STATE register indicates the optional availability of the presentation layer, which is providing confidentiality and integrity protection of payloads (APDUs) transferred across the I2C interface. The presentation layer is used as part of Shielded Connection. |

OPTIGA™ Trust M

Appendix B - OPTIGA™ Trust M Command/Response I2C Sample Logs

11 Appendix B - OPTIGA™ Trust M Command/Response I2C Sample Logs

The default I2C slave address for the OPTIGA™ Trust M is 0x30 [I2C_ADDR]. All the values in this section are specified in decimal form unless stated otherwise.

11.1 Sequence of commands to read Coprocessor UID from OPTIGA™ Trust M

Pre-requisites

1. Ensure that the security device is powered up
2. The OPTIGA™ Trust M will not acknowledge the slave address sent by a host if it is either busy or in idle state. Hence the host must retry or repeat the transaction until it is successful or timed out for 100 milliseconds (extreme case).
3. The specified guard time must be applied between each attempt of write / read operation by the Host I2C driver.
4. The log information for OPTIGA™ Trust M commands specified in below Tables contains the [IFX I2C] protocol information which comprises sequence numbers and checksum of the transactions.
 - a. A sequence of commands must be strict for the OPTIGA™ Trust M (e.g. OpenApplication followed by GetDataObject to read a Coprocessor UID)
 - b. A checksum in the data depends on the data received or sent via write/read operations. So any data change in the transaction is reflected in the check sum. Otherwise the write data transaction will not be accepted/acknowledged by the OPTIGA™ Trust M.
5. The logs specified below are without the presentation layer (used for the Shielded Connection) of [IFX I2C]

11.1.1 Check the status [I2C_STATE]

This is a very basic register read operation which ensures the behavior of the read/write operations of the local host I2C driver.

Table 25 Check I2C_STATE Register of OPTIGA™ Trust M

| I2C_ADDR | Transaction Type | Data [values in hexadecimal] |
|----------|--------------------|------------------------------|
| 30 | Write [01 Bytes] | 82 |
| 30 | Read [04 Bytes] | 08 80 00 00 |

11.1.2 Issue OpenApplication command

Before issuing any application specific command; e.g. read Coprocessor UID using GetDataObject, it is a must to send the OpenApplication command to initialize the application on the OPTIGA™ Trust M as shown below.

Table 26 OpenApplication on OPTIGA™ Trust M

| I2C_ADDR | Transaction Type | Data [values in hexadecimal] |
|---|--------------------|---|
| Step 1: Send OpenApplication command to initiate the application context on the OPTIGA™ Trust M | | |
| 30 | Write [27 Bytes] | 80 03 00 15 00 70 00 00 10 D2 76 00 00 04 47 65 6E 41 75 74 68 41 70 70 6C 04 1A |
| Step 2: Read the I2C_STATE register [<i>Repeat this step until the read contains the data as specified</i>] | | |

12 Appendix C – Power Management

When operating, the power consumption of OPTIGA™ Trust M is limited to meet the requirements regarding the power limitation set by the Host. The power limitation is implemented by utilizing the current limitation feature of the underlying hardware device in steps of 1mA from 6mA to 15 mA with a precision of ±5%.

12.1 Hibernation

This maximizes power saving (zero power consumption¹), while the I2C bus stays connected. In this case OPTIGA™ Trust M saves the application context before power-off (switching off V_{CC}) and restores it after power-up. After power-up the application continues seamlessly from the state before hibernate.

12.2 Low Power Sleep Mode

The OPTIGA™ Trust M automatically enters a low-power mode after a configurable delay. Once it has entered Sleep mode, the OPTIGA™ Trust M resumes normal operation as soon as its address is detected on the I2C bus. In case no command is sent to the OPTIGA™ Trust M it behaves as shown in Figure 13.

1. As soon as the OPTIGA™ Trust M is idle it starts to count down the “delay to sleep” time (t_{SDY}).
2. In case this time elapses the device enters the “go to sleep” procedure.
3. The “go to sleep” procedure waits until all idle tasks are finished (e.g. counting down the SEC). In case all idle tasks are finished and no command is pending, the OPTIGA™ Trust M enters sleep mode.
